Re: Review and human health risk assessment of TRC Phase II Air Monitoring Results for Volatile Organic Compounds (VOCs)

Dear Tom;

I reviewed the results of the Phase II VOC 24-hr air sampling results which are attached. The samples were collected on January 19-20, January 26-27 and February 1-2, in the same locations as the Phase I samples. After reviewing the results of the Phase I VOC sampling, it was recommended that since the detected chemicals are often present at low levels in ambient air, background samples would be collected during the next phase of sampling to determine the impact of local conditions on ambient air and to determine whether alternative sources are present. An additional background sample location was not collected during the Phase II sampling, however, the Aluf Facility was not operating during the January 19<sup>th</sup> -20<sup>th</sup> sampling event and therefore this represents a non-facility impacted comparison sample for the other two samples at each sampling location.

Similar to the results from the Phase I VOC air sampling, the Phase II VOC sampling showed concentrations of Acrolein, Benzene and Carbon Tetrachloride elevated above New York State Department of Environmental Conservation's respective annual guideline concentrations (AGCs). Hexachlorobutadiene was detected in only one of 12 samples during the Phase I VOC sampling, was not detected in the Phase II samples. 1,3-Butadiene was detected above AGCs in 11 of 12 samples in the Phase II samples, but was not detected during the Phase I VOC sampling event.

The AGCs were developed to evaluate the potential for offsite fence line concentrations of toxic air pollutants emitted by a facility by using an USEPA approved air dispersion model. The model calculates worst-case air concentrations at specific receptor locations using measured stack emissions data, stack input data (height, flow rate and temperature) and local meteorology. The AGCs do not take into account any background concentrations or

additional sources that may be present in ambient air. Additionally, the AGC is for comparison against a modeled maximum annual average air concentration and the Phase II samples were taken over a 24 hour period, therefore, the direct comparison of the measured concentrations from the 24-hour samples to the AGCs (annual guideline concentrations) are not comparable as it is a comparison of a short-term sample to a long-term average.

A discussion of those compounds that exceeded the AGCs is provided below.

- A. Acrolein was detected in 10 of 12 Phase II VOC samples, with detected concentrations above the AGC, but below the SGC. However, as noted above, since the sample obtained was a 24-hour sample, it is not comparable to the long-term AGC benchmark value. A statistical evaluation comparing the samples collected when the facility was not operating (January 19-20) versus the other two sample dates (January 26-27 and February 1-2) when the facility was in operation, showed that the acrolein air concentrations were not significantly different (see attached statistical output). This indicates that there are other sources of acrolein in the ambient air other than the Aluf Facility. Acrolein is commonly found in car and diesel exhaust, cigarette smoke, and is also released from burning wood, other plant material and burning oil (e.g., home heating oil) (ATSDR 2007a<sup>1</sup>).

Additionally, as discussed in the TRC Letter to the Board, dated December 1, 2017, it was hypothesized that the elevated acrolein concentrations detected in the Phase I VOC sampling round and in the residential sampling could be due to the inadequate cleaning of the summa canisters as it pertains to acrolein and potential “acrolein growth in the canisters. For the Phase II sampling, TRC instructed the laboratory to follow EPA procedures and heat each canister to 90°C. Acrolein concentrations from the Phase I VOC sampling round ranged from <1.6 ug/m<sup>3</sup> (non-detect) to 5.4 ug/m<sup>3</sup>, while the residential samples ranged from 1.6 ug/m<sup>3</sup> to 5.9 ug/m<sup>3</sup>. In contrast, acrolein concentrations from the Phase II VOC sampling round ranged from <0.49 ug/m<sup>3</sup> (non-detect) to 1.5 ug/m<sup>3</sup>. The maximum detected concentration was obtained on Glenshaw Street on the day the facility was not operating. Additionally, there is large truck traffic and train traffic near that sampling location and as mentioned, previously, acrolein is commonly found in diesel exhaust.

- B. Benzene was detected in 12 of 12 Phase II VOC samples above its AGC, but below the SGC. However, as noted above, since the sample obtained was a 24-hour sample, it is not comparable to the long-term AGC benchmark value. A statistical evaluation comparing the samples collected when the facility was not operating (January 19-20) versus the other two sample dates (January 26-27 and February 1-2) when the facility was in operation, showed that the benzene air concentrations were not significantly different (see attached statistical output). This indicates that there are other sources of benzene in the ambient air other than the Aluf Facility. Benzene is a component of

---

<sup>1</sup> ATSDR 2007a. Toxicological Profile for Acrolein. On-Line at:  
<https://www.atsdr.cdc.gov/substances/toxsubstance.asp?toxicid=102>

gasoline and is emitted in the exhaust and through evaporation of vehicle fuel and also as a component of heating oil (ATSDR 2007b<sup>2</sup>).

Benzene concentrations from the Phase I VOC sampling round ranged from 0.33 ug/m<sup>3</sup> to 0.8 ug/m<sup>3</sup>, while the residential samples ranged from 0.25 ug/m<sup>3</sup> to 1 ug/m<sup>3</sup>. The benzene concentrations from the Phase II VOC sampling round ranged from 0.7 ug/m<sup>3</sup> to 1.3 ug/m<sup>3</sup> which are higher than the Phase I results. The highest detected concentrations were obtained on the day the facility was not operating.

C. Carbon Tetrachloride was detected in 12 of 12 Phase II VOC samples above its AGC, but below the SGC. However, as noted above, since the sample obtained was a 24-hour sample, it is not comparable to the long-term AGC benchmark value. A statistical evaluation comparing the samples collected when the facility was not operating (January 19-20) versus the other two sample dates (January 26-27 and February 1-2) when the facility was in operation, showed that the carbon tetrachloride air concentrations were not significantly different (see attached statistical output). This indicates that there are other sources of carbon tetrachloride in the ambient air other than the Aluf Facility. Carbon Tetrachloride is primarily an industrial chemical used to make some refrigerants and propellants for aerosols, as a solvent for oils, fats, lacquers, varnishes, rubber waxes and resins (USEPA 2016<sup>3</sup>). It is also found in indoor air due to the presence in cleaning products. It was found at high concentrations in chlorine bleach containing household products (Odabasi 2008<sup>4</sup>).

Carbon tetrachloride concentrations from the Phase I VOC sampling round ranged from 0.37 ug/m<sup>3</sup> to 0.51 ug/m<sup>3</sup>, and it was not detected in the residential samples. The carbon tetrachloride concentrations from the Phase II VOC sampling round ranged from 0.39 ug/m<sup>3</sup> to 0.46 ug/m<sup>3</sup> which are consistent with the Phase I results.

D. 1,3-Butadiene was detected in 11 of 12 Phase II VOC samples, with detected concentrations above the AGC, but below the SGC. However, as noted above, since the sample obtained was a 24-hour sample, it is not comparable to the long-term AGC benchmark value. A statistical evaluation comparing the samples collected when the facility was not operating (January 19-20) versus the other two sample dates (January 26-27 and February 1-2) when the facility was in operation, showed that the 1,3-butadiene air concentrations were not significantly different (see attached statistical output). This indicates that there are other sources of 1,3-butadiene in the ambient air other than the Aluf Facility. 1,3-butadiene has been measured in the exhaust of typical automobiles and light trucks and in the exhaust from diesel engines (ATSDR

<sup>4</sup> Odabasi, M. 2008. Halogenated Volatile Organic Compounds from the Use of Chlorine-Bleach-Containing Household Products. Environmental Science & Technology. 42(5): 1445-51.

). It is also emitted from wood combustion in residential fireplaces and wildfires (ATSDR 2012<sup>5</sup>).

The results of the Phase I VOC samples and the resident VOC samples showed no detected concentrations of 1,3-butadiene. The concentrations of 1,3-butadiene from the Phase II VOC sampling round ranged from <0.059 ug/m<sup>3</sup> (non-detect) to 0.23 ug/m<sup>3</sup>.

Since these chemicals are consistently present at low levels in ambient air, both when the facility is in operation and when it is not, these air contaminants appear to be due to sources other than the Aluf Facility. Additionally, based on the detected concentrations, they would not be expected to represent a health concern to exposed individuals. As previously discussed, none of the detected concentrations exceed the SGCs, and all though they do exceed the AGCs, these are 24-hour samples and not modeled annual air concentrations.

Very Truly Yours,

TRC Environmental Corporation

Karen M. Vetrano, Ph.D  
Manager, Risk Assessment and Toxicology

## 1 Introduction

Aluf Plastics Incorporated (API) manufactures plastic bags and has been the subject of odor complaints in the neighborhoods surrounding the facility for over a year. There have been roughly 260 submitted complaints (some with multiple dates and time of odor detection) from March 1, 2017 – February 28, 2018 submitted to the Town of Orangetown (the Town). The odor descriptions included burning/burnt plastic, with and without a floral odor; melting plastic, with and without a floral odor; plastic; floral/perfume; chemical; “Aluf odor”; choking, noxious and “urinal cake”. Other non-specific descriptions such as strong odor/smell and potent smell were also recorded. Figure 1 provides a summary of the locations of the odor detections listed in the complaints. The majority of odor complaints have been reported in neighborhoods, less than a half mile away, and to the north – northwest of API.

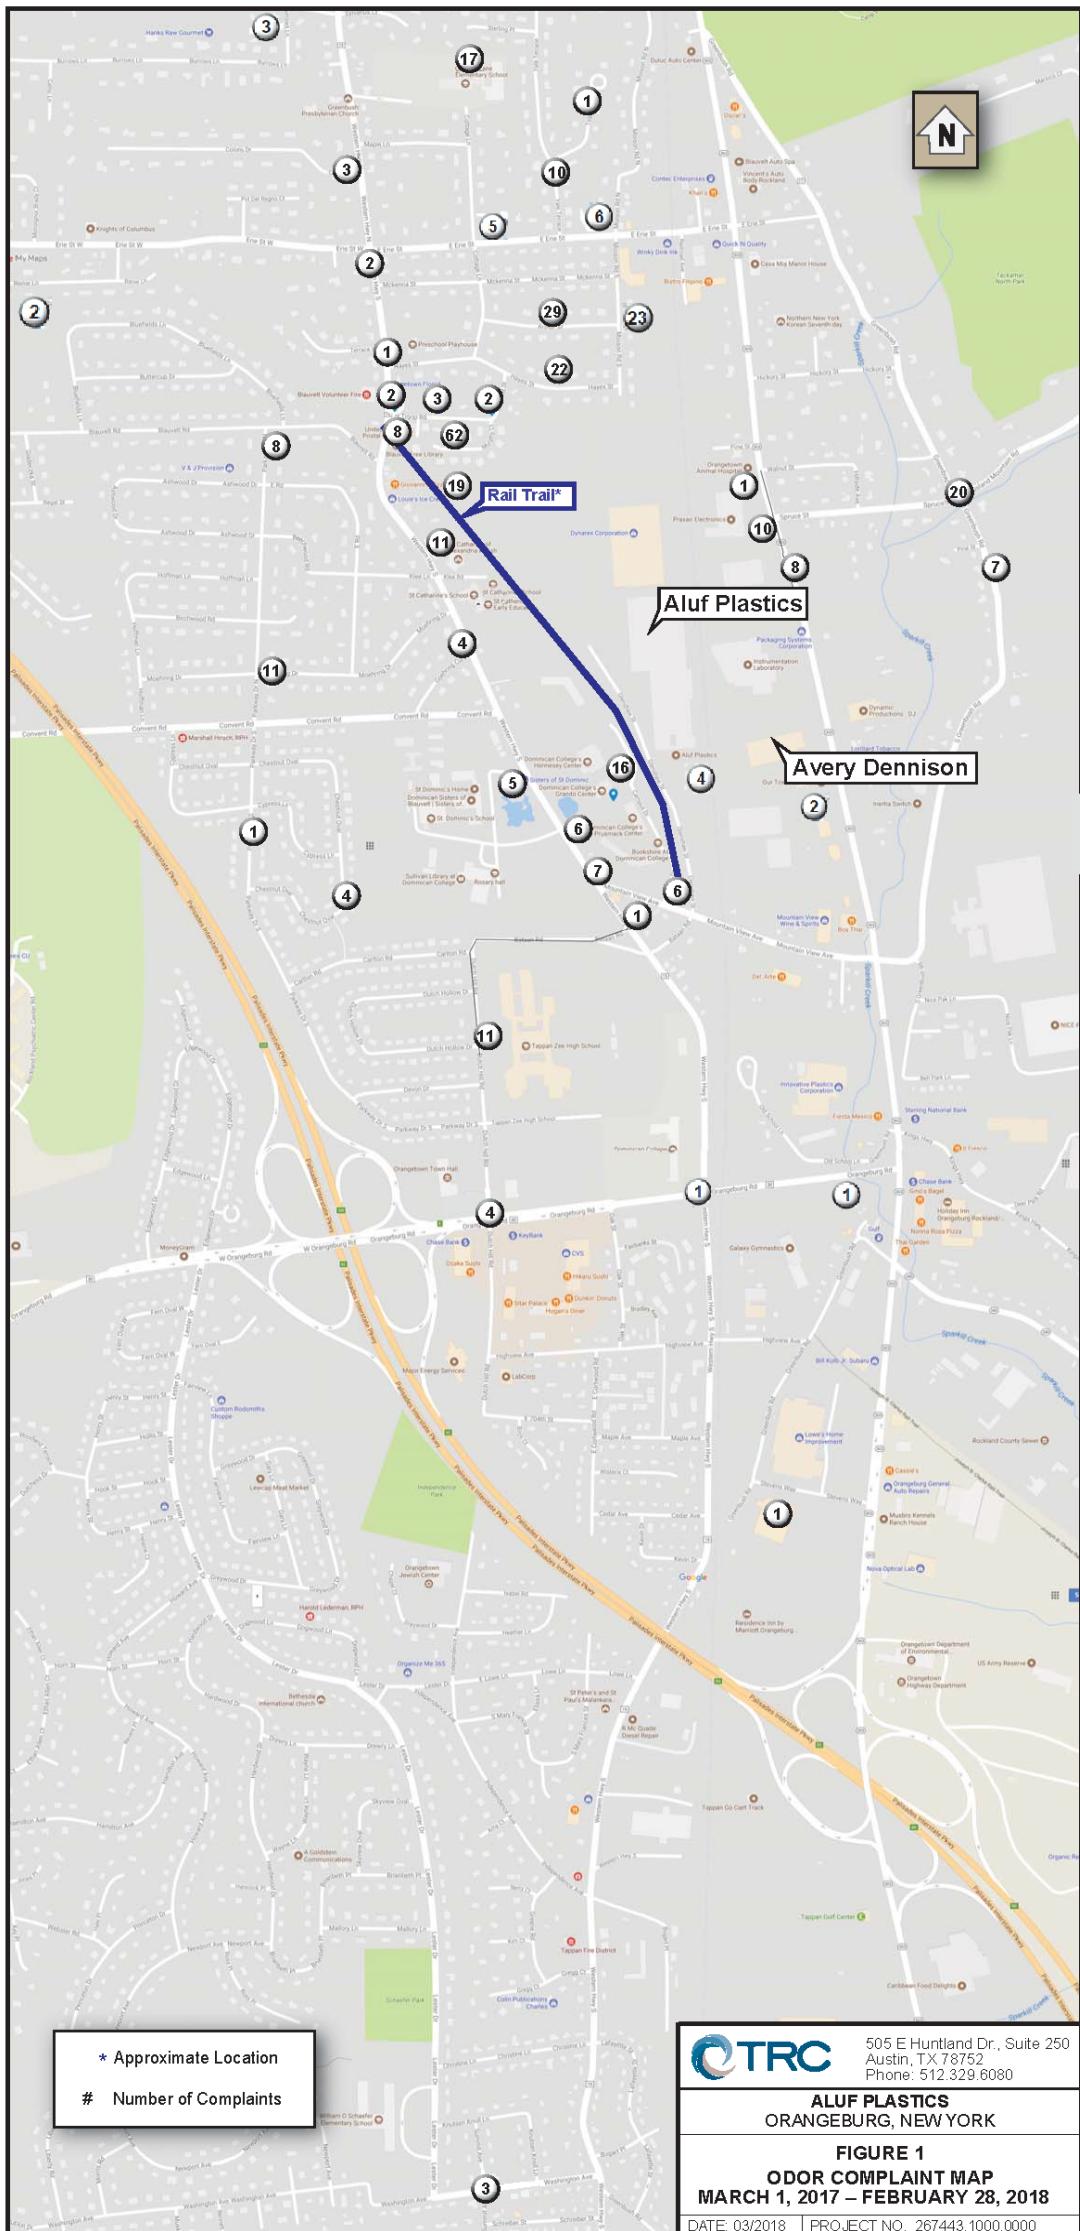

In July of 2017, TRC was retained by the Town to conduct an air quality monitoring program in two phases; including ambient air sampling in the vicinity of API and meteorological monitoring in Orangeburg, NY. TRC installed a meteorological monitoring station on the roof of the Orangeburg Highway Department building on August 7<sup>th</sup> and completed Phase I of the ambient air monitoring program in August 2017. Phase II of the air monitoring program was completed in February 2018. Between Phase I and Phase II a number of ambient air samples were collected by local residents and Town employees. Air samples were collected in accordance with US EPA Method TO-15 and submitted for analysis for volatile organic compounds (VOCs) to Con-Test Laboratory in East Longmeadow, Massachusetts.

In June of 2017, API sought a permit to upgrade the ventilation system at the facility. Upgrades were completed later in 2017, and Phase II of the sampling program was initiated. Results for the final sampling phase are included in this report.

The results from the Phase I VOC air sampling showed that concentrations of acrolein, benzene, carbon tetrachloride and hexachlorobutadiene exceeded New York State Department of Environmental Conservation’s respective short-term guideline concentrations (SGCs) and annual guideline concentrations (AGCs). Additionally, concentrations of acrolein (7 samples) and tetrachloroethylene (1 sample) exceeded their respective SGCs, and acrolein (9 samples) and benzene (10 samples) exceeded their respective AGCs in the resident samples.

TRC performed a human health risk assessment based on the results from Phase I and resident samples (Review and human health risk assessment of TRC Air Monitoring Results for Volatile Organic Compounds (VOCs), dated December 21, 2017). For reasons discussed in detail in the assessment report, TRC does not believe that exposure to these measured concentrations would result in negative health effects.

Figure 1: Odor Complaint Map

## 2 Methodology

At the request of the Orangetown Town Board, TRC developed a scope of work for this air quality monitoring program to include the following:

- Two three-week sampling studies to measure concentrations of VOCs, in accordance with US EPA Method TO-15, at four monitoring locations following the US EPA national six day schedule;
- Training of town residents and/or staff in the deployment and collection of TO-15 samples for immediate sampling in response to odors;
- On-site odor expert to identify odor sources and conduct an odor survey;
- On-site meteorological monitoring station to identify upwind and downwind sampling locations and aid in odor source identification.

### 2.1 Air Sampling for Volatile Organic Compounds

VOCs were collected using 6-liter evacuated stainless steel SUMMA® canisters fitted with a calibrated regulator at the sample inlet. The regulator allows continuous sample collection over a 24-hour period. Sampling locations were selected based on previous VOC sampling and their proximity to API and upwind and downwind locations from the meteorological data. Sampling locations are identified in Figure 2. Samples were collected at each sampling location once every six days over a three week period. The samples were subsequently shipped to Con-Test Analytical Laboratory in East Longmeadow, MA and analyzed using EPA Method TO-15 by gas chromatography/mass spectrometry (GC/MS). Sampling dates and times for the first phase of ambient air sampling are summarized in Table 1.

*Table 1: Phase II Sampling Dates and Times*

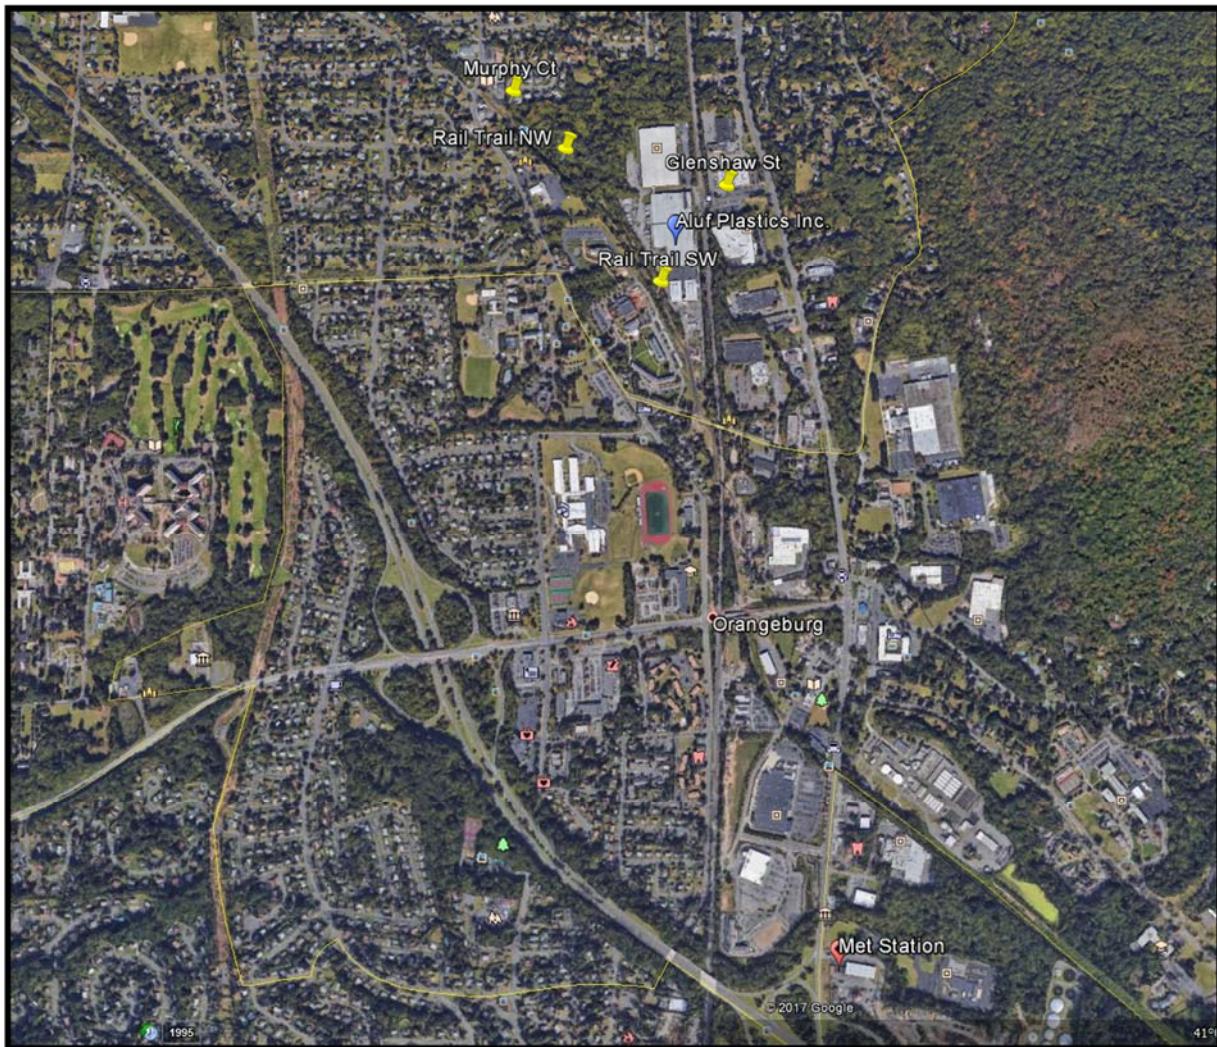

Sampling Event	Sample Location	Start Time	End Time
4	Rail Trail SW	1/19/18 17:50	1/20/18 16:46

### 2.2 Meteorological Monitoring

A meteorological station (Met Station) was erected on the roof of the Orangeburg Highway Department Building located on Route 303 in Orangeburg, NY. Meteorological monitoring has been operating continuously since installation on August 7<sup>th</sup>. The Met Station is equipped with sensors to measure wind speed, wind direction, temperature, relative humidity, and barometric pressure on a continuous basis. The RM Young Response One meteorological sensor system is used for meteorological measurements.

Not only did this met station help identify upwind and downwind sampling locations during both phases of this monitoring program, it also provided hourly averaged wind directions to track odor complaints as reported to the Town.

*Figure 2: Sampling Locations and Meteorological Monitoring Station*

### 3 Summary of Results

#### 3.1 Volatile Organic Compounds

During Phase II, a total of twelve VOC samples were collected and analyzed in accordance with US EPA Method TO-15. Individual samples were collected over a 24-hour period at four locations during three sampling events. Of the 63 compounds analyzed, as part of US EPA Method TO-15, 36 were detected in one or more of the samples collected during this phase of the program. A summary of average and maximum concentrations of detected results from the VOC samples collected during Phase II are presented in Table 2. Please note average concentrations were calculated by handling non-detected results as values half of the lab's analytical reporting limit. This approach assumes that on the average all values between the RL and zero could be present, and that the average value of non-detects could be as high as half the detection limit.

Samples collected at the Rail Trail NW on January 26<sup>th</sup> – 27<sup>th</sup> and at Murphy Court on February 1<sup>st</sup> – 2<sup>nd</sup> reached capacity before the end of the 24 hour sample time. These two sampling systems failed to maintain a constant flow rate resulting in an unknown sample duration.

Complete results from each of the twelve samples collected during Phase II are presented in Attachment A. Laboratory Data Packages are included in Attachment B.

As discussed in TRC's December 1, 2017 letter to the Town Board in response to Dr. Dimitri Laddis' November 27th letter to the Board, it was determined that the laboratory results for acrolein were likely biased high due to "acrolein growth" in the canisters. In order to minimize bias in Phase II samples, the laboratory was instructed to follow EPA guidance for cleaning procedures specific to the measurement of acrolein. Additionally, NYSDEC analyzed collocated samplers at two locations during each sampling event.

Table 2: Summary of VOC Results - Phase II

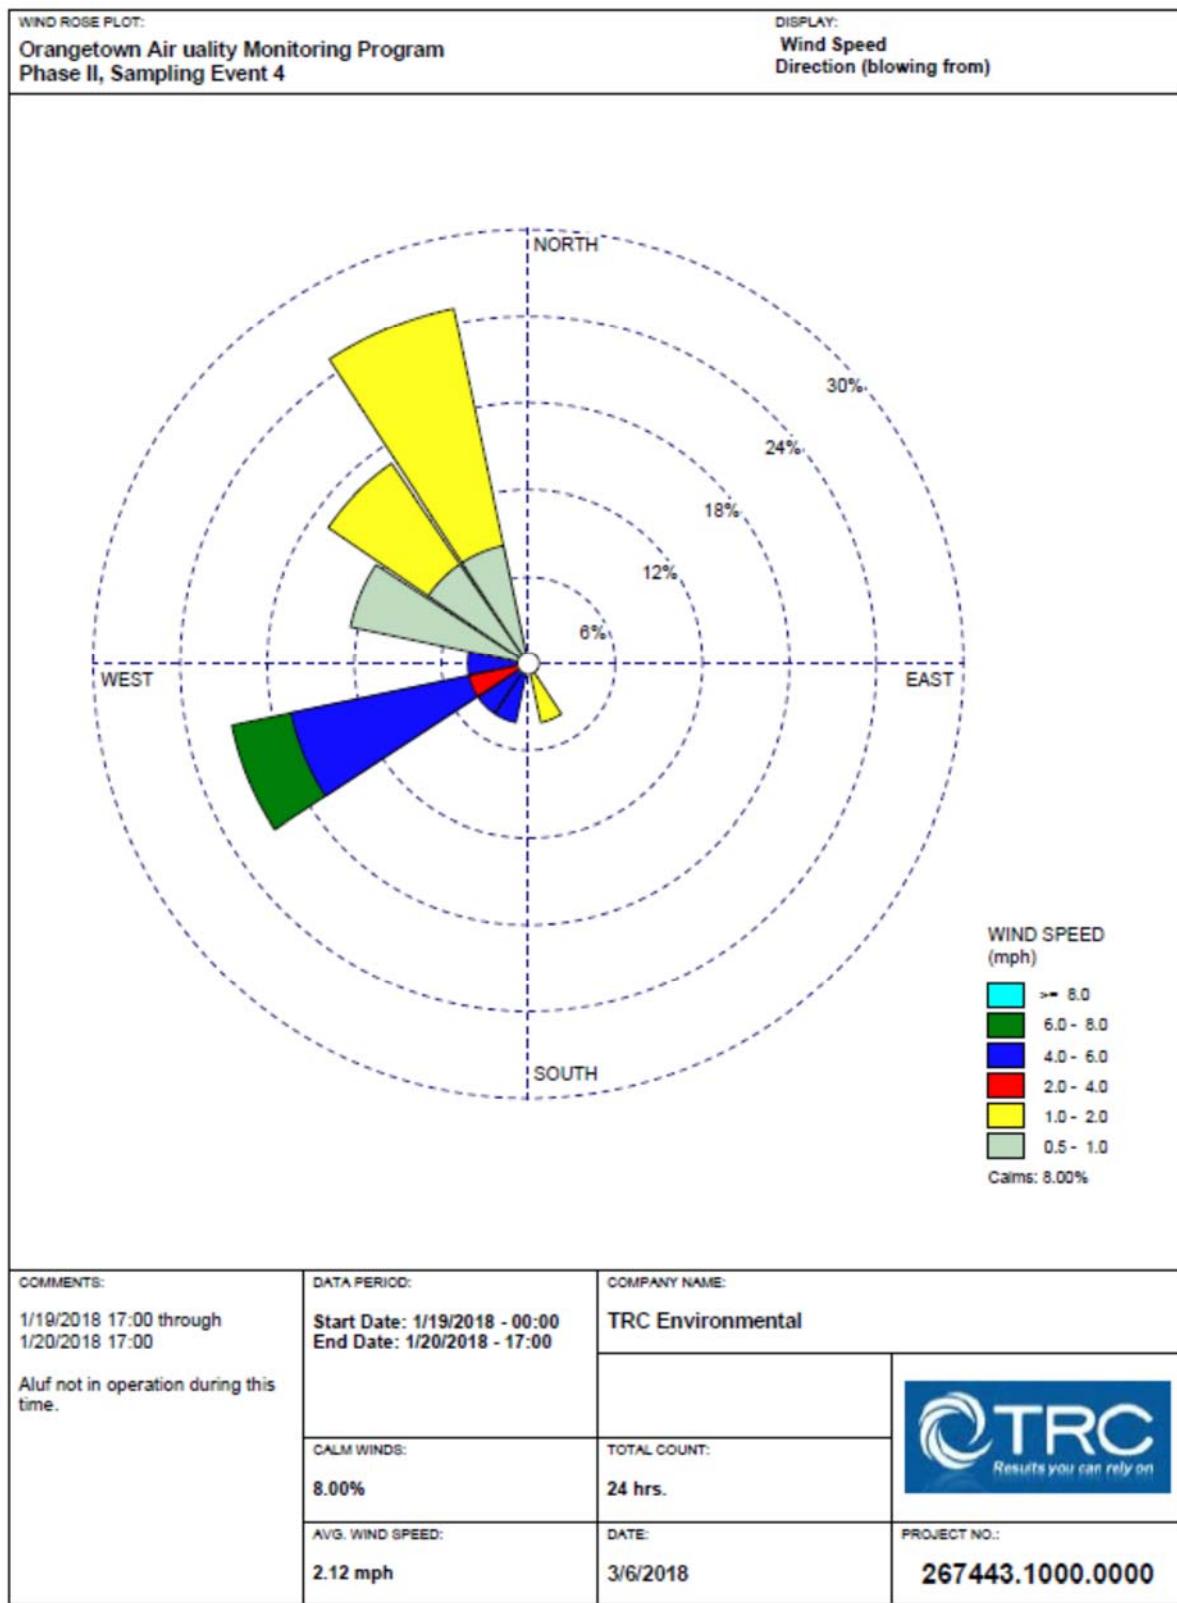

VOCs - TO-15	Number of Detects	Average Concentration		Maximum Concentration			
		ND = 1/2 RL		ppbV	ug/m3	Date Sampled	Location Sampled

### 3.2 Meteorological Summary

The on-site met station has been operating and recording met parameters, including wind speed and wind direction, continuously since installation on August 7, 2017. Meteorological data for each sample day is presented as individual wind rose plots in Figures 3 through 5. A wind rose plot is a graphic representation of the distributed winds. The spokes in the wind rose plot show the greatest frequency of the wind direction and the colored bands show the range of wind speed. Additionally, values below the lowest wind speed range are reported as calm conditions and listed as a percentage of the total winds.

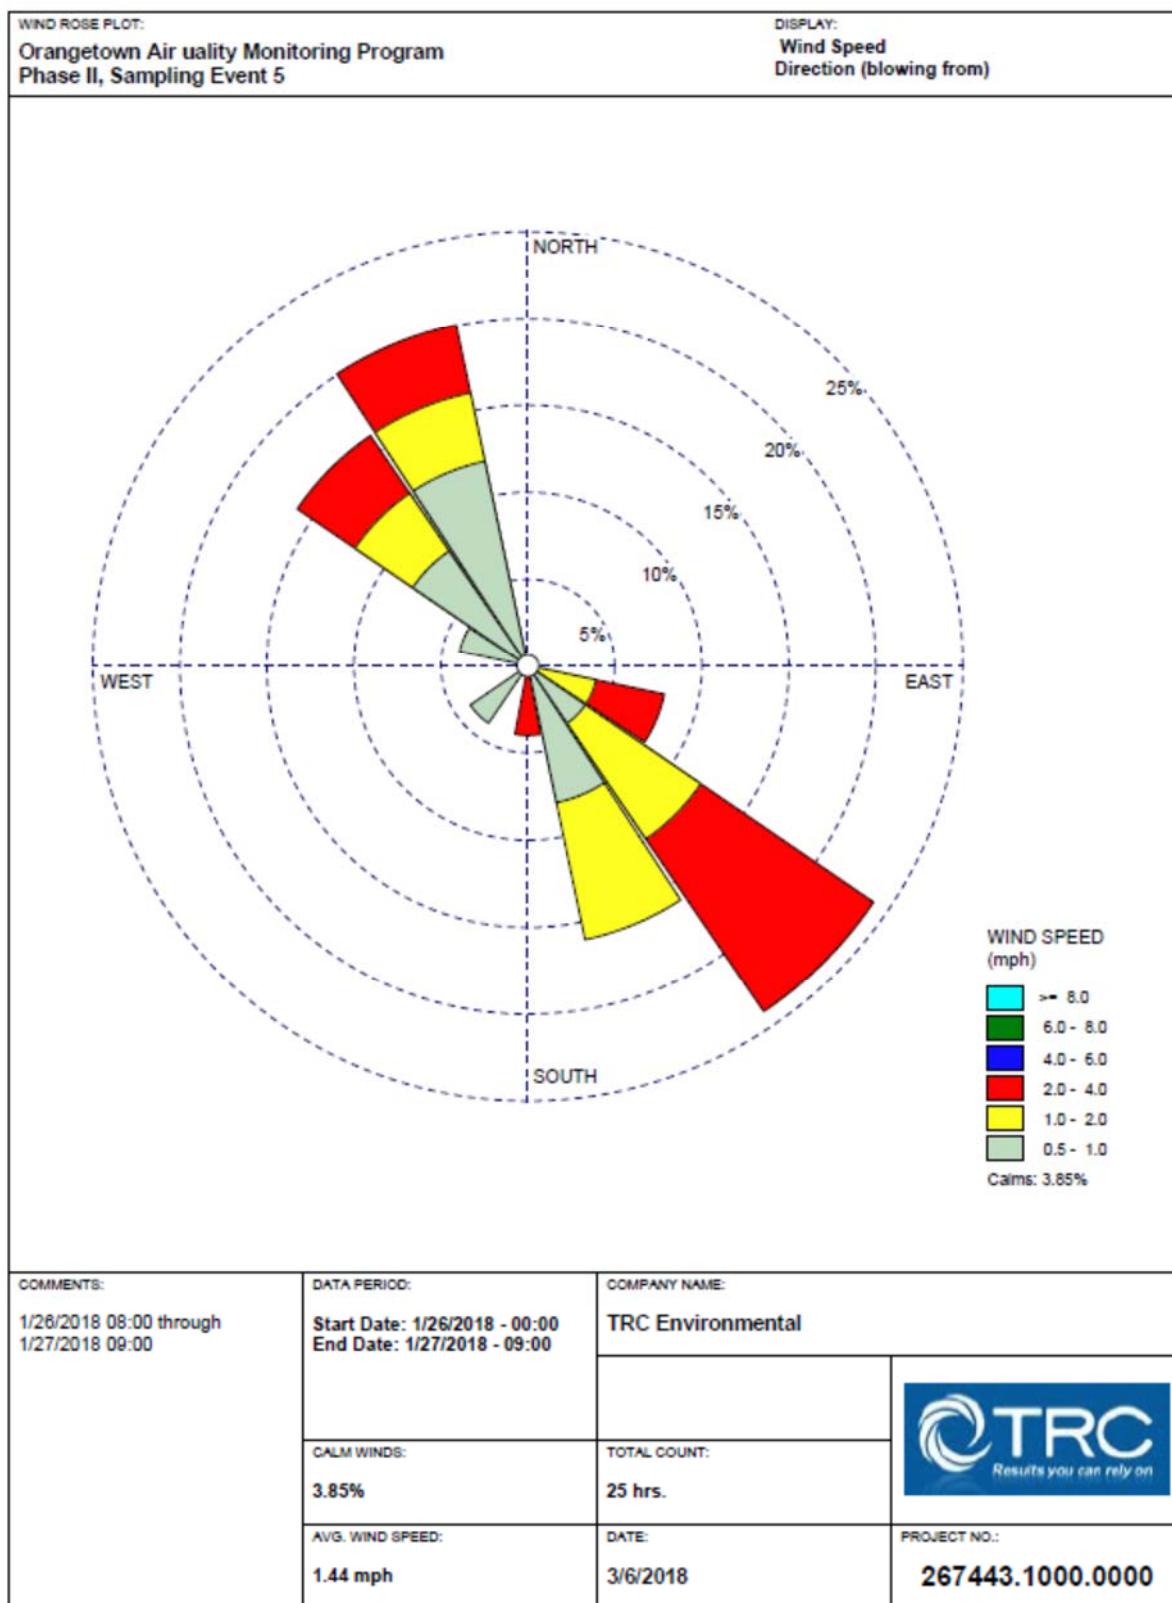

From the wind rose plots, the winds were mostly variable during these 24-hour sampling events. Winds during the fourth sampling event (January 19<sup>th</sup> – 20<sup>th</sup>), were mostly made up of westerly components, predominantly from the north northwest, west southwest, and northwest. Winds during the fifth sampling even (January 26<sup>th</sup> – 27<sup>th</sup>) were split, coming from the northwest and the southeast. Winds during the final sampling event (February 1<sup>st</sup> – 2<sup>nd</sup>) were predominantly made up of southerly components, coming from the south, southeast, and south southeast; there was a brief but strong component from the northwest as well.

## 4 Conclusions

As shown in table 2: acetone, ethanol, ethylbenzene, 2-butanone, toluene, m & p-xylene, and o-xylene were detected in all 12 samples; acrolein was detected in ten samples.

Based on the information provided regarding emitting facilities in Orangetown (Aluf Plastics, Inc. and Avery Dennison), there are at least eight compounds of interest that are included in the VOC analysis of samples collected during both phases of this air quality monitoring program.

- Acrolein
- Ethanol
- Methyl Ethyl Ketone (2-Butanone)
- Acetone
- Ethylbenzene
- Toluene
- Xylenes (m&p-xylene and o-xylene)

For comparison, average concentrations for these eight VOCs in samples collected as part of this program as well as from samples collected in different areas of the United States are shown in Table 3.

Similar to the results from the Phase I VOC air sampling, the Phase II VOC sampling showed concentrations of acrolein, benzene and carbon tetrachloride elevated above New York State Department of Environmental Conservation's respective annual guideline concentrations (AGCs). 1,3-Butadiene was detected above AGCs in 11 of 12 samples in the Phase II samples, but was not detected during the Phase I VOC sampling event. Industrial uses of these four compounds are outlined below:

- Acrolein is a clear or yellow liquid with a burned, sweet, pungent odor. Primarily used as an intermediate in the synthesis of acrylic acid and as a biocide. It may be formed from the breakdown of certain pollutants in outdoor air or from the burning of organic matter including tobacco, or fuels such as gasoline or oil. (EPA, 2009)
- Benzene is a colorless liquid with a sweet odor. It is used to make some types of rubbers, lubricants, dyes, detergents, drugs, and pesticides. Natural sources of benzene include volcanoes and forest fires. Benzene is also a natural part of crude oil, gasoline, and cigarette smoke. (ATSDR, 2011)
- Carbon tetrachloride is a manufactured chemical that does not occur naturally. It is a clear liquid with a sweet smell that can be detected at low levels. (ATSDR, 2011) It was produced in large quantities to make refrigerants and propellants for aerosol cans, as a solvent for oils, fats, lacquers, varnishes, rubber waxes, and resins, and as a grain fumigant and a dry cleaning agent. Consumer and fumigant uses have been discontinued and only industrial uses remain. (EPA, 2000)
- 1,3-Butadiene is a colorless gas with a mild gasoline-like odor. Most 1,3-butadiene is used to make man-made rubber, which is then used mostly for car and truck tires. 1,3-Butadiene is also used to make certain types of plastics such as acrylics. Releases of 1,3-butadiene into the air occur from vehicle exhaust, tobacco smoke, wood burning, burning of rubber and plastic, forest fires, and accidental or intentional release at manufacturing plants (ATSDR, 2012).

There were no odor complaints from residents during any of the Phase II sampling events. TRC has provided a human health risk assessment based on the results from Phase II of this monitoring program and concludes that ambient concentrations of VOCs would not be expected to represent a health concern to exposed individuals.

AGC: Annual Guideline Concentrations developed by NYSDEC, 2016

## 5 Recommendations

### 5.1 Air Sampling

TRC recommends obtaining NYS DEC's data from the collocated samples during Phase II. This information will assist in data validation and further understanding the ambient air concentrations for VOCs in Orangetown.

Since, odors continue to be reported by API's residential neighbors, TRC also recommends to continue collection of VOC grab samples as warranted by odor complaints. In addition to TO-15 samples, TRC suggests sampling for aldehydes in accordance with US EPA Method TO-11. The objective of conducting air sampling specifically for aldehydes would be to 1) determine the presence and concentration of aldehydes in the air surrounding API, and 2) confirm whether or not aldehydes from API are contributing to the odors detected by residents.

### 5.2 Odor Sampling

TRC's Odor Control and Measurement group is currently performing an odor study of operations at API, and have at this point identified a number of potential odor sources, including exhaust stacks and wall fans. This group will conduct odor sampling, conduct chemical analyses on a selection of those samples, and perform dispersion modeling of pollutants of concern. Data obtained from the odor survey will be extremely valuable in developing an air monitoring program that can focus on specific pollutants to monitor and identify the impacts API, and other sources, have on air quality in Orangetown.

#### ANALYTICAL SUMMARY

WORK ORDER NUMBER: 18A0800

The results of analyses performed on the following samples submitted to the CON-TEST Analytical Laboratory are found in this report.

PROJECT LOCATION: Orangetown, NY

FIELD SAMPLE #	LAB ID:	MATRIX	SAMPLE DESCRIPTION	TEST	SUB LAB
Rail Trail SW-1/20/18	18A0800-01	Air		EPA TO-15	
Rail Trail NW-1/20/18	18A0800-02	Air		EPA TO-15	
Murphy-1/20/18	18A0800-03	Air		EPA TO-15	
Glenshaw-1/20/18	18A0800-04	Air		EPA TO-15	

**CASE NARRATIVE SUMMARY**

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

The results of analyses reported only relate to samples submitted to the Con-Test Analytical Laboratory for testing.  
I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

Lisa A. Worthington  
Project Manager

**ANALYTICAL RESULTS**

Project Location: Orangetown, NY  
 Date Received: 1/24/2018  
**Field Sample #:** Glenshaw-1/20/18  
**Sample ID:** 18A0800-04  
 Sample Matrix: Air  
 Sampled: 1/20/2018 18:35

Sample Description/Location:  
 Sub Description/Location:  
 Canister ID: 2228  
 Canister Size: 6 liter  
 Flow Controller ID: 3672  
 Sample Type: 24 hr

**Work Order:** 18A0800  
 Initial Vacuum(in Hg):  
 Final Vacuum(in Hg):  
 Receipt Vacuum(in Hg): -4.6  
 Flow Controller Type: Fixed-Orifice  
 Flow Controller Calibration  
 RPD Pre and Post-Sampling:

**EPA TO-15**

**FLAG/QUALIFIER SUMMARY**

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
RL	Reporting Limit
MDL	Method Detection Limit
RPD	Relative Percent Difference
LCS	Laboratory Control Sample
LCS Dup	Duplicate Laboratory Control Sample
MS	Matrix Spike Sample
MS Dup	Duplicate Matrix Spike Sample
REC	Recovery
QC	Quality Control
ppbv	Parts per billion volume
EPA	United States Environmental Protection Agency
% REC	Percent Recovery
ND	Not Detected
N/A	Not Applicable
DL	Detection Limit
NC	Not Calculated
LFB/LCS	Lab Fortified Blank/Lab Control Sample
ORP	Oxidation-Reduction Potential
wet	Not dry weight corrected
% wt	Percent weight
Kg	Kilogram
g	Gram
mg	Milligram
µg	Microgram
ng	Nanogram
L	Liter
mL	Milliliter
µL	Microliter
m³	Cubic Meter
EPH	Extractable Petroleum Hydrocarbons
VPH	Volatile Petroleum Hydrocarbons
APH	Air Petroleum Hydrocarbons
FID	Flame Ionization Detector
PID	Photo Ionization Detector
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
J	Detected but below the Reporting Limit (lowest calibration standard); therefore, result is an estimated concentration (CLP J-Flag).

REPORT DATE: 2/8/2018

PURCHASE ORDER NUMBER: 111950

PROJECT NUMBER: 267443.1000.000

#### ANALYTICAL SUMMARY

WORK ORDER NUMBER: 18A1061

The results of analyses performed on the following samples submitted to the CON-TEST Analytical Laboratory are found in this report.

PROJECT LOCATION: Orangetown, NY

FIELD SAMPLE #	LAB ID:	MATRIX	SAMPLE DESCRIPTION	TEST	SUB LAB
Rail Trail SW-1/26/18	18A1061-01	Air		EPA TO-15	
Rail Trail NW-1/26/18	18A1061-02	Air		EPA TO-15	
Murphy-1/26/18	18A1061-03	Air		EPA TO-15	
Glenshaw-1/26/18	18A1061-04	Air		EPA TO-15	

#### CASE NARRATIVE SUMMARY

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

#### EPA TO-15

##### **Qualifications:**

Duplicate relative percent difference (RPD) is a less useful indicator of sample precision for sample results that are <5 times the reporting limit (RL).

##### **Analyte & Samples(s) Qualified:**

###### **2-Hexanone (MBK)**

B196437-DUP1

Continuing calibration did not meet method specifications and was biased on the high side for this compound. Reported result is estimated.

##### **Analyte & Samples(s) Qualified:**

###### **Heptane**

18A1061-01[Rail Trail SW-1/26/18], 18A1061-02[Rail Trail NW-1/26/18], 18A1061-03[Murphy-1/26/18], 18A1061-04[Glenshaw-1/26/18], B196437-BS1, B196437-DUP1, S019971-CCV1

Continuing calibration did not meet method specifications and was biased on the high side. Data validation is not affected since sample result was "not detected" for this compound.

##### **Analyte & Samples(s) Qualified:**

###### **1,4-Dioxane, Naphthalene, trans-1,3-Dichloropropene**

B196437-BS1, S019971-CCV1

Sample had a final pressure of zero.

##### **Analyte & Samples(s) Qualified:**

18A1061-02[Rail Trail NW-1/26/18]

The results of analyses reported only relate to samples submitted to the Con-Test Analytical Laboratory for testing.  
I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

Lisa A. Worthington  
Project Manager

**FLAG/QUALIFIER SUMMARY**

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
RL	Reporting Limit
MDL	Method Detection Limit
RPD	Relative Percent Difference
LCS	Laboratory Control Sample
LCS Dup	Duplicate Laboratory Control Sample
MS	Matrix Spike Sample
MS Dup	Duplicate Matrix Spike Sample
REC	Recovery
QC	Quality Control
ppbv	Parts per billion volume
EPA	United States Environmental Protection Agency
% REC	Percent Recovery
ND	Not Detected
N/A	Not Applicable
DL	Detection Limit
NC	Not Calculated
LFB/LCS	Lab Fortified Blank/Lab Control Sample
ORP	Oxidation-Reduction Potential
wet	Not dry weight corrected
% wt	Percent weight
Kg	Kilogram
g	Gram
mg	Milligram
µg	Microgram
ng	Nanogram
L	Liter
mL	Milliliter
µL	Microliter
m³	Cubic Meter
EPH	Extractable Petroleum Hydrocarbons
VPH	Volatile Petroleum Hydrocarbons
APH	Air Petroleum Hydrocarbons
FID	Flame Ionization Detector
PID	Photo Ionization Detector
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
J	Detected but below the Reporting Limit (lowest calibration standard); therefore, result is an estimated concentration (CLP J-Flag).
R-04	Duplicate relative percent difference (RPD) is a less useful indicator of sample precision for sample results that are <5 times the reporting limit (RL).
V-06	Continuing calibration did not meet method specifications and was biased on the high side for this compound. Reported result is estimated.
V-20	Continuing calibration did not meet method specifications and was biased on the high side. Data validation is not affected since sample result was "not detected" for this compound.
Z-01	Sample had a final pressure of zero.

**ANALYST**

RLF	Rebecca Faust
RAP	Raisa A. Petraitis
MEK	Meghan E. Kelley
JLH	Jessica L. Hoffman
CMR	Catherine M. Rouleau

#### ANALYTICAL SUMMARY

WORK ORDER NUMBER: 18B0249

The results of analyses performed on the following samples submitted to the CON-TEST Analytical Laboratory are found in this report.

PROJECT LOCATION: Orangetown

FIELD SAMPLE #	LAB ID:	MATRIX	SAMPLE DESCRIPTION	TEST	SUB LAB
Rail Trail SW-2/1/18	18B0249-01	Air		EPA TO-15	
Rail Trail NW-2/1/18	18B0249-02	Air		EPA TO-15	
Murphy-2/1/18	18B0249-03	Air		EPA TO-15	
Glenshaw-2/1/18	18B0249-04	Air		EPA TO-15	

**CASE NARRATIVE SUMMARY**

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

**EPA TO-15**

**Qualifications:**

Laboratory fortified blank /laboratory control sample recovery outside of control limits. Data validation is not affected since all results are "not detected" for all samples in this batch for this compound and bias is on the high side.

**Analyte & Samples(s) Qualified:**

**1,2,4-Trichlorobenzene, Hexachlorobutadiene**

B196969-BS1

Surrogate outside of control limits.

**Analyte & Samples(s) Qualified:**

**4-Bromofluorobenzene (1)**

18B0249-04[Glenshaw-2/1/18]

Compound fails the method requirement of 70-130% recovery for the LCS. Is classified by the lab as a difficult compound and passes the in house limits of 50-150%.

**Analyte & Samples(s) Qualified:**

**Naphthalene**

18B0249-01[Rail Trail SW-2/1/18], B196969-BS1

Sample had a final pressure of zero.

**Analyte & Samples(s) Qualified:**

18B0249-03[Murphy-2/1/18]

The results of analyses reported only relate to samples submitted to the Con-Test Analytical Laboratory for testing.

I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

Lisa A. Worthington  
Project Manager

1,1,2-Trichloro-1,2,2-trifluoroethane (Freon 113)	5.42		5.00		108	70-130					
1,2,4-Trimethylbenzene	5.39		5.00		108	70-130					
1,3,5-Trimethylbenzene	5.27		5.00		105	70-130					
Vinyl Acetate	4.29		5.00		85.7	70-130					
Vinyl Chloride	4.68		5.00		93.6	70-130					
m&p-Xylene	9.43		10.0		94.3	70-130					
o-Xylene	5.00		5.00		99.9	70-130					
Surrogate: 4-Bromo fluoro benzene (l)	10.1		8.00		126	70-130					

**FLAG/QUALIFIER SUMMARY**

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
RL	Reporting Limit
MDL	Method Detection Limit
RPD	Relative Percent Difference
LCS	Laboratory Control Sample
LCS Dup	Duplicate Laboratory Control Sample
MS	Matrix Spike Sample
MS Dup	Duplicate Matrix Spike Sample
REC	Recovery
QC	Quality Control
ppbv	Parts per billion volume
EPA	United States Environmental Protection Agency
% REC	Percent Recovery
ND	Not Detected
N/A	Not Applicable
DL	Detection Limit
NC	Not Calculated
LFB/LCS	Lab Fortified Blank/Lab Control Sample
ORP	Oxidation-Reduction Potential
wet	Not dry weight corrected
% wt	Percent weight
Kg	Kilogram
g	Gram
mg	Milligram
µg	Microgram
ng	Nanogram
L	Liter
mL	Milliliter
µL	Microliter
m³	Cubic Meter
EPH	Extractable Petroleum Hydrocarbons
VPH	Volatile Petroleum Hydrocarbons
APH	Air Petroleum Hydrocarbons
FID	Flame Ionization Detector
PID	Photo Ionization Detector
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
J	Detected but below the Reporting Limit (lowest calibration standard); therefore, result is an estimated concentration (CLP J-Flag).
L-01	Laboratory fortified blank /laboratory control sample recovery outside of control limits. Data validation is not affected since all results are "not detected" for all samples in this batch for this compound and bias is on the high side.
S-26	Surrogate outside of control limits.
Z-01	Compound fails the method requirement of 70-130% recovery for the LCS. Is classified by the lab as a difficult compound and passes the in house limits of 50-150%.
Z-01a	Sample had a final pressure of zero.
